Water Quality Report

2020 FIELD SEASON

OUR ORGANIZATION

The Nashwaak Watershed Association was established in 1995 as a not-for-profit organization. Our organization restores land that can protect river water quality and we engage people on responsible use.

Vision

We envision people caring for a clean, healthy, and beautiful Nashwaak River watershed that supports and connects people and wildlife for years to come.

Mission

To promote, conserve, and restore the Nashwaak ecosystem by using science-based methods, community collaboration, and advocacy for the watershed and its inhabitants.

OUR WATERSHED

Maintaining the quality of the surface water is extremely important for ensuring a healthy watershed. Clean water is one of New Brunswick's most important resources. We rely on it for drinking, growing food, manufacturing goods, producing electricity, and for recreational activities. The flora and fauna of the Nashwaak watershed also rely on clean water.

The NWAI resumed water quality monitoring in the summer of 2017. We monitor 12 standard sites monthly throughout the field season. Occasionally we sample other sites related to our restoration projects.

WHAT DO WE MEASURE?

Water Temperature	Water needs to be cold enough for some species (like salmon and trout) to survive
Dissolved Oxygen	Ecosystems need a minimum amount of oxygen in the water to support healthy aquatic life
Conductivity	This is the water's ability to transmit electricity- changes are due to dissolved solids, and may impair the survival of some species
Metals	Metals are introduced into water from weathering or erosion of soils or rocks either naturally, or at an increased speed due to human activities
рН	This measures how acidic/basic the water is - neutral levels are best for fish. Changes to the natural pH might impact the nutrients or toxins in the water
Dissolved Solids	Dissolved solids can be anything from organic material, to minerals, to pollutants. Too many dissolved solids harm aquatic life and may indicate contaminated runoff.
Nutrients	While some nutrients are healthy, too many nutrients (like phosphorus and nitrogen) can cause algae and harm ecosystems. Nutrients often come from manure and fertilizer in runoff.
E. Coli	<i>E. coli</i> are bacteria that live in the digestive tract of warm blooded animals and are used to indicate the potential presence of harmful organisms.

THE WATER QUALITY INDEX

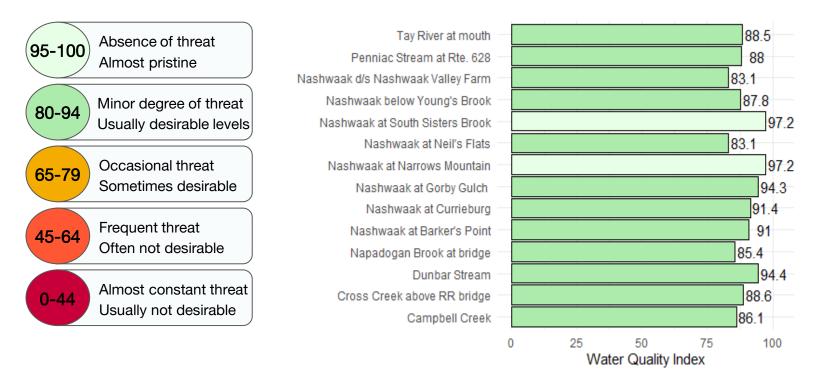

Using the Canadian Council of Ministers of the Environment water quality guidelines, the Water Quality Index (WQI) combines multiple parameters into a single value that summarizes water quality at a site. It is calculated based on:

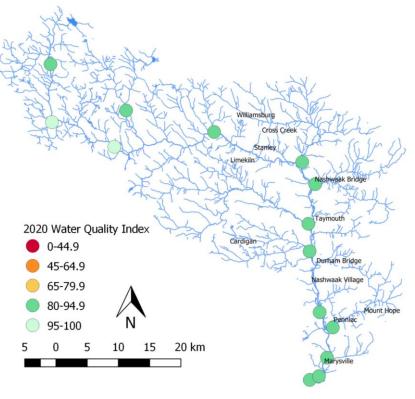

- the number of parameters that exceed guidelines,
- the number of times guidelines are exceeded,
- and the amount by which they are exceeded.

For an accurate WQI, a site is required to have 4 samples per year with at least 4 variables measured.

OUR WATER QUALITY INDEX SCORES

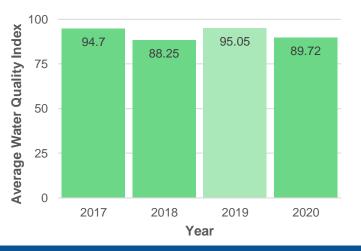

The WQI was calculated using: arsenic, cadmium, chloride, dissolved oxygen, E. coli, iron, ammonia, molybdenum, nitrite, nitrate, lead, pH, selenium, silver, thallium, total dissolved solids, temperature, phosphorus, turbidity, uranium, and zinc

WQI SUMMARY

WQIs throughout the watershed have stayed relatively the same over the last 4 years. Guidelines exceedances were due most often to E. coli, DO, phosphorus, and iron. Overall in 2020, the water quality was considered excellent!

FURTHER ANALYSIS

Dissolved oxygen (DO) is a measure of the oxygen available in the water. Over the summer of 2020, the DO for all sites averaged above the CCME limit of 6.5 mg/l (protection for all life stages) but two sites in the lower watershed averaged below the CCME limit of 9.5 mg/L (protection of early life).

Avg. Dissolved Oxygen

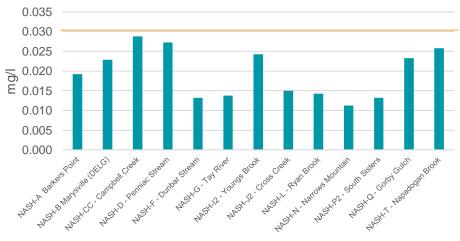

Avg. E.Coli Concentration

E. coli concentrations exceeded the CCME limit of 400 MPN/100 mL for a single grab sample seven times in 2020. However, all of these exceedances occurred after a period of heavy rainfall in October, which flushed accumulated bacteria into the river system. All other samples taken in the summer of 2020 were under 140 MPN/100 mL.

Phosphorus levels were elevated in the lower watershed (below Penniac), around Young's Brook, and in the headwaters (but still below the 0.03 mg/L "limit of concern"). Most sites had higher concentrations of phosphorus on average compared to previous years. Sources of phosphorus include fertilizers, manure, and organic wastes.

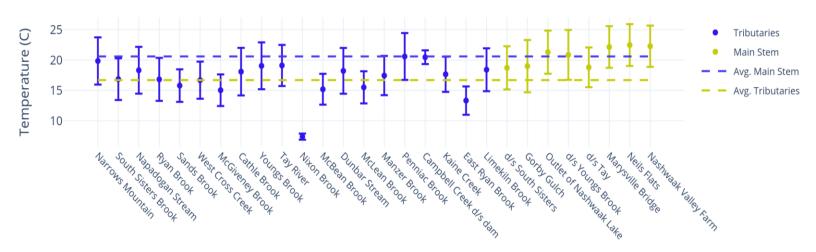

Avg. Phosphorus Concentration

TEMPERATURE MONITORING

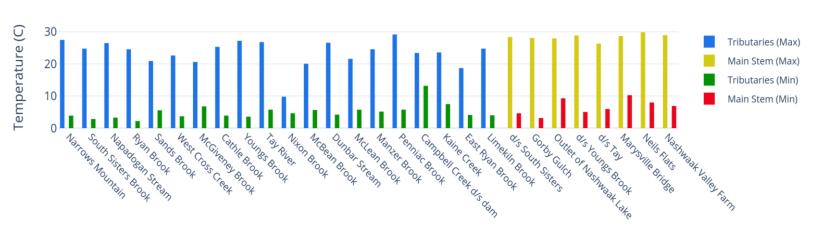

In 2020 we deployed 34 temperature loggers in both tributaries and along main stem to measure water temperature every six hours between May and October. Over time, the monitoring of temperature on our ecologically important tributaries will help us to understand the source of thermal inputs and the location of more thermal refuges within the watershed.

Average summer water temperatures

2020 was a hot, dry summer. The average temperature over the summer in the monitored tributaries was 16.7 °C while in the main stem it was 20.6 °C.

Maximum and Minimum Temperatures

Only two tributaries remained below 20 °C all summer this year. Maximum temperatures were observed in the main stem with the warmest temperatures observed at Neil's Flats (29.9 °C) and Nashwaak Valley Farm (29.0 °C). Penniac Brook also reached 29.1 °C, making it the warmest tributary in the watershed.

GET INVOLVED IN YOUR WATERSHED!

How can you improve the water quality of the Nashwaak watershed?

1. *Green the shoreline*: Maintain & plant native vegetation along watercourses to provide homes for wildlife, shade the water, reduce erosion, & filter pollutants.

2. Fence watercourses near farms: Livestock are a major source of E. coli & can erode riverbanks. Fencing the watercourse is better for both the river & the animals.

3. *Keep sewage out of the river:* Ensure that your domestic septic tanks are regularly maintained.

4. *Reduce chemical inputs*: Use phosphatefree & biodegradable cleaning products & personal care products. Reduce the use of pesticides on lawns and gardens and clean up pet waste.

5. *Reduce impervious surfaces*: Use porous alternatives & collect runoff in a rain barrel or plant a rain garden.

6. Learn more about your watershed & its issues.

The Nashwaak Watershed Association relies on the support of its members & their generous contributions of both time and money to help promote & advocate the health of the Watershed. Membership is \$10, however any donation you choose to make helps support education & awareness programs, sustainability projects, & advocacy to protect & preserve this valuable resource. Your membership also gives you a voice in helping to shape the future of the Watershed. Join today!

Acknowledgements

Thank you to the Environmental Trust Fund and the Wildlife Trust Fund who helped make this work possible! And to the Atlantic Water Network for providing the report template and R scripts.
